# SAFE-FOLLOWING DISTANCES BASED ON THE CAR-FOLLOWING MODEL 

Department of Highways
Thailand

## Overview

- Introduction
- Methodology
- Data Collection
- Results
- Conclusions

## Introduction

- More than 100,000 traffic accidents per year (12,000 deaths).
- Rear-end collisions ~ most common
- Aim of this research $\sim$ reduce the severity and the number of road accidents.
- Derive safe following distance.
- Assist drivers with treatment marking.

## Driving Task

Traffic Stability
$>1^{\text {st }}$ decelerates.
$>$ Others react.
$>7^{\text {th }}$ and $8^{\text {th }}$ collide.

## Car-Following

## - Notation:

$$
\text { Follower } \quad \text { Leader }
$$

$\square x_{n}(t)-x_{n+1}(t)=$ spacing $($ space headway $)=l_{n+1}(t)+\mathrm{VL}$
$\square$ speed of vehicle $\mathrm{n}: \frac{d x_{n}(t)}{d t}=\dot{x}_{n}(t)$
$\square$ acceleration (decceleration) of vehicle $\mathrm{n}: \frac{d \dot{x}_{n}(t)}{d t}=\frac{d^{2} x_{n}(t)}{d t}=\ddot{x}_{n}(t)$
$\square \dot{x}_{n}(t)-\dot{x}_{n+1}(t)=\dot{l}_{n+1}(t)$

## GM 5 ${ }^{\text {th }}$ Car-Following

$$
\ddot{x}_{n+1}(t+T)=\frac{\alpha\left[\dot{x}_{n+1}(t+T)\right]^{m}}{\left[x_{n}(t)-x_{n+1}(t)\right]^{l}}\left\{\dot{x}_{n}(t)-\dot{x}_{n+1}(t)\right\}
$$

where $\ddot{x}_{n+1}(t+T)$ is the acceleration of the $\mathrm{n}+1$ th car at time $\mathrm{t}+\mathrm{T}$
$\dot{x}_{n+1}(t+T)$ is the velocity of the $\mathrm{n}+1$ th car at time $\mathrm{t}+\mathrm{T}$
$x_{n}(t)$ is the distance of the n th car at time t
$x_{n+1}(t)$ is the distance of the $\mathrm{n}+1$ th car at time t
$\dot{x}_{n}(t)$ is the velocity of the n th car at time t
$\dot{x}_{n+1}(t)$ is the velocity of the $\mathrm{n}+1$ th car at time t
$\alpha$ is the sensitivit y factor
$m, l$ are constant

## Methodology

- Calibrate the car-following model
- Analyze stability condition
- Derive safe following distance

## Methodology

- Convert GM5th => Traffic Stream Model

## Methodology

- Introduce error terms

$$
v_{i}=v_{f} \cdot\left[1-\left(\frac{k_{i}}{k_{j}}\right)^{\gamma-1}\right]^{\frac{1}{1-\beta}}+\varepsilon_{i}
$$

$$
\begin{aligned}
& \varepsilon_{i} \sim N\left[0, \sigma^{2}\right] \\
& f\left(\varepsilon_{i}\right)=\frac{1}{\sqrt{2 \pi \sigma^{2}}} \cdot e^{-\frac{1}{2 \sigma^{2}} \varepsilon_{i}^{2}}
\end{aligned}
$$

- Log-likelihood

$$
\ln L\left(\beta, \gamma, v_{f}, k_{j}, \sigma^{2}\right)=-\frac{N}{2} \ln \left(2 \pi \sigma^{2}\right)-\frac{1}{2 \sigma^{2}} \cdot \sum_{i=1}^{N}\left[v_{i}-v_{f}\left[1-\left(\frac{k_{i}}{k_{j}}\right)^{\gamma-1}\right]^{\frac{1}{1-\beta}}\right]^{2}
$$

## Stability Condition

- The Governing Equation of the car following model

$$
\ddot{x}_{n+1}(t+T)=\frac{\alpha\left[\dot{x}_{n+1}(t+T)\right]^{m}}{\left[x_{n}(t)-x_{n+1}(t)\right]^{l}}\left\{\dot{x}_{n}(t)-\dot{x}_{n+1}(t)\right\}
$$

- Perturb the equilibrium solution with a small deviation term

$$
X_{n}(t)=b \cdot n+v \cdot t+\varepsilon(n, t) \text { where } \varepsilon(n, t)=f_{n} \cdot e^{i \omega t}
$$

## Stability Condition

$$
\frac{\alpha \cdot[v]^{\beta}}{b^{\gamma}} \cdot T \leq \frac{1}{2}
$$

Where $\mathrm{v}=$ prevailing speed
$\mathrm{T}=$ reaction time
$\mathrm{b}=$ distance headway

## Case Study

- National Highway 7 (Chon Buri Motorway)
- Located at km $50+000$ toward Chon Buri
- Traffic volumes ~heavy during weekend morning and afternoon peak periods (ADT ~60,000)

## Study Site

## Study Site

## Detector Placement

## Calibration Result

| Parameter | Mean | Standard Error | t-ratio |
| :---: | :--- | :---: | :---: |
| $\sigma^{2}$ | 33.646 | 2.238 | 15.034 |
| $\mathrm{~V}_{\mathrm{f}}$ | 95.716 | 0.080 | $1,196.450$ |
| $\mathrm{k}_{\mathrm{i}}$ | 116.067 | 1.482 | 78.318 |
| Y | 4.510 | 0.042 | 107.143 |
| $\beta$ | 0.990 | 0.00002 | 49500.000 |

## Comparison of Recommended Following Distances

| Speed (km/h) | Safe Following Distance (m) |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Pipes'* | Forbes'* | Calibrated GM | 2-second Rule |
| 80 | 30.00 | 38.33 | 49.76 | 44.44 |
| 90 | 33.13 | 42.50 | 51.06 | 50.00 |
| 100 | 36.25 | 46.67 | 52.26 | 55.56 |
| 110 | 39.38 | 50.83 | 53.36 | 61.11 |
| 120 | 42.50 | 55.00 | 54.39 | 66.67 |
| 130 | 45.63 | 59.17 | 55.35 | 72.22 |
| * Assume average vehicle length of 5 meters.$\square$ Recomm ended following distances |  |  |  |  |

## Following Distances Based on Different Car-Following Models

## Speed-Flow Curve

Speed-Flow Curve of the Traffic on the National Highway 7 toward Chon Buri

## "DOT" <br> Tailgating Treatment

## Sign and Pattern Layout

## "DOT" Tailgating Treatment

Width:Length $=1: 3$ ratio*

Typical Marking

| Alternative | $\mathrm{A}(\mathrm{m})$ | $\mathrm{B}(\mathrm{m})$ | Area $(\mathrm{sq} \mathrm{m})$ |
| :---: | :---: | :---: | :---: |
| Motorway | 2.25 | 0.75 | 1.33 |

${ }^{\prime}$ Based on standard colong pavement markings referenced in the MUTCD

| Comprehenslon Time | $:$ | 5 | sec |

| 80 | 50 | 41 | 15 | 574 | 1300 | 1440 |
| 90 | 52 | 43 | 16 | 645 | 1500 | 1560 |
| 100 | 53 | 44 | 18 | 748 | 1600 | 1700 |
| 110 | 54 | 45 | 19 | 810 | 1800 | 1830 |
| 120 | 55 | 46 | 20 | 874 | 2000 | 1960 |

* Remark

1. If the observed volume exceeds the capacity provided in this table, the "DOT" tailgating treatment should not installed.
2. The "DOT" tailgating treatment should only be installed to the location where rear-end collisions due to aggressive driving behaviors are frequent.

## CONCLUSIONS

- MLE $\Rightarrow$ calibrate $=>$ GM 5th car-following model
- Assist drivers => Following distance for speed range $80-120 \mathrm{~km} / \mathrm{h}$

## FUTURE RESEARCH

- More Data Collection

Reaction Time $=>$ determination More Field Applications => validation

## THANK YOU
